

Short Composition on Computer

[Hints: introduction, invention, working system, usefulness, conclusion]

The computer is a wonder of modern science. The present world is called the computer world. Science is now the driving force of modern civilization. Science has entered everywhere. There are so many inventions which are serving in respective fields. The computer is invented by the hard work of many scientists. Charles Babbage is called the father of modern Computer at first in 1833. His invented computer had five parts. There were the store, mill, control input and output. By following the structure of the computer of Charles Babbage, Harvard invented the IBM computer in 1944. After this, it has been rapidly modified and many other computers have been invented. A computer performs three functions. It receives data. At first, the details of the work are put in the input of the computer. It is called programme. The computer does not work in our language. So the programme is to put in its own language. This programme is typed and produced in the processing unit of the results with the help of a printing machine. Its signal goes to the memory and the control unit reads to the arithmetic unit. After finishing its tasks it, sends them to the result of output. Thus the result is emitted by the computer. Computer is very useful for us. It is used in our daily life of various purpose. Computer has made a great change in education. The students of developed countries use computer prepare their study materials. The result of various examinations is prepared accurately by computer within a short time. Besides printing thousands of books are made within a short time, computer contribute a lot in education. At present computer is used to diagnose disease. A new process of operation is invented by the computer an alternative of surgery. Besides this, the computer is used to grindstones in the normal pathological test. Science should be meant for the service of

humanity computer is the greatest contribution of science. It is expected to render the greatest service of humanity by substituting the human brain. I think this computer can help Bangladesh to solve many unsolved problems. So, this is one of the wonders of modern science.
