

# Describe and Analyze the Chart of The Production of Winter Vegetables

**Question:** The bar chart shows vegetable production in winter. Describe and analyze the chart.

## Winter Vegetables

**Answer:** The bar chart shows the production of five types of winter vegetables in thousand tons. These vegetables are Red amaranth, Moolis, Tomato, Cauliflower, and Cabbage. From the chart, it is clear that, of the five types of vegetables, cauliflower production is the highest. It is almost 100 thousand tons. The next in production is cabbage which is more than 90 thousand tons. Tomato production lies in the third position. It is nearly 40 thousand tons. The other two types of vegetables, red amaranth, and moolis are produced in the same quantity, each 20 thousand tons. Thus, at a glance, we find that tomato production is almost double the quantity of either red amaranth or moolis. Cabbages and cauliflowers are abundantly produced, and their production far outweighs the production of other types of vegetables shown in the chart.
