

## Paragraph on ICT/Flourishment of ICT

ICT (information and communications technology or technologies) is an umbrella term. It includes any communication device or application, such as radio, television, cellular phones, computer and internet, satellite systems and so on. Videoconferencing and distance learning is a very important part of ICT. Now ICT is often used in a particular context, such as ICT in education, health care, or libraries. And at present days ICT is mainly associated with the internet, computer, and mobile. However, ICT has no universal definition; the definition depends on how you use present-day technology. In practice, we can say that ICT is what we do on the internet.
